

**Snoasis Medical Inc.**

**Amniotic tissue gingival wound covering**

Said to be the first membrane composed of donated amnion tissue—the innermost lining of the placenta which encloses an unborn baby—**BioCover** can be used as a wound covering in the treatment of gingival recession. This dehydrated graft does not need to be hydrated prior to use and does not require sutures; it naturally adheres to the surgical site. Lack of intrusion and trauma to the gums decreases post-surgery pain and recovery time.

**BioCover**, the first donated amnion tissue membrane, naturally adheres to surgical sites, decreasing post-op pain and recovery time.
